Subject: draft Aspect paragraph

The Aerial Spectral Photometric Environmental Collection Technology (ASPECT) Program is conduct screening level assessments to evaluate the unreported or undetected releases of hazardous materials or contaminants from industrial sites. The screening level results from ASPECT will be compared to the ASPECT list of Texas Commission on Environmental Quality (TCEQ) short-term Air Monitoring Comparison Values (AMCVs). If the short-term AMCVs are exceeded, the Division Supervisor, Incident Commander and the EU in cooperation with Texas TCEQ will determine if a Site-Specific Evaluation will be conducted.

The ASPECT was directed to overfly the Arkema Site by the EPA Incident Commander ESF10. The ASPECT was able to detect the burning peroxide at low levels in the smoke plume and some peroxide volatilizing off the trailers containing peroxides. The other chemicals in the ASPECT short term air monitoring comparison values (AMCV) list were not detected above the benchmarks.
